Spamfighter — setup in 5 minutes

You don't need to be a computer person. If you can download a file and double-click it, you can do this.

Step 1: Install Python (one time, ~3 minutes)

Python is the free tool that runs Spamfighter. You only install it once.

1. Go to **https://www.python.org/downloads/**
2. Click the big yellow **"Download Python"** button.
3. Run the installer. **IMPORTANT:** on the very first screen, check the little box that says **"Add python.exe to PATH"** — then click "Install Now."
1. Done. You never have to think about Python again.

Step 2: Get Spamfighter

Download the `spamfighter` folder and put it somewhere easy to find, like your Desktop or Documents. (It'll come from GitHub — one download, no installing.)

Step 3: Save a spam email as a file

This is the only "new" skill, and it takes 10 seconds:

- **Gmail:** open the spam email, click the **...** menu (top right), click **"Download message."** Move the downloaded file into Spamfighter's `inbox` folder.
- **Outlook (desktop):** open the email, **File > Save As**, save it into the `inbox` folder (it saves as .eml automatically).
- **Outlook (web):** open the email, **...** menu, look for a download / save option, move the file into `inbox`.
- **Apple Mail:** select the email, **File > Save As**, choose **"Raw Message Source,"** save into `inbox`.
- **Thunderbird:** right-click the email, **Save As > File**, save into `inbox`.

Do it for every spam email you want to fight. Ten emails? Save ten files.

Step 4: Run it

Windows: double-click **RUN.bat**.

Mac/Linux: double-click **RUN.sh** (or right-click > Open).

A black window opens, thinks for a bit, and closes. That's it.

Step 5: Open the `reports` folder

For every spam email you get three files:

- **REPORT.md** — plain-English breakdown: who really sent it, what server it came from, the red flags. Double-click to read it.
- **COMPLAINT.txt** — a ready-to-send abuse complaint. It tells you the exact email address to send it to. Copy the text into a new email, **attach the original .eml file**, hit send. That's the punch.
- **NEXT-STEPS.txt** — where else to report it: the FTC, Google Safe Browsing, the FBI. Five minutes, no account needed.

Your saved emails automatically move to `inbox/done` so you never process the same one twice.

That's the whole thing

Save spam → double-click → send complaints. Every complaint you send lands on the desk of the company whose servers the scammer abused, and every FTC/Safe Browsing report raises the scammer's cost of doing business. You're not deleting spam anymore. You're billing them for it.

Questions? You're already doing more than 99% of people by reading this far. Go get them.
